

CS169 Week 4 Section

Administrivia & Agenda

- **HW3 Sinatra** is due this **Saturday 9/28 @ 11:59pm**
- Peer Reviews for **HW2** due **Friday 9/27 @ 11:59pm**
- Project List will be released **this week**

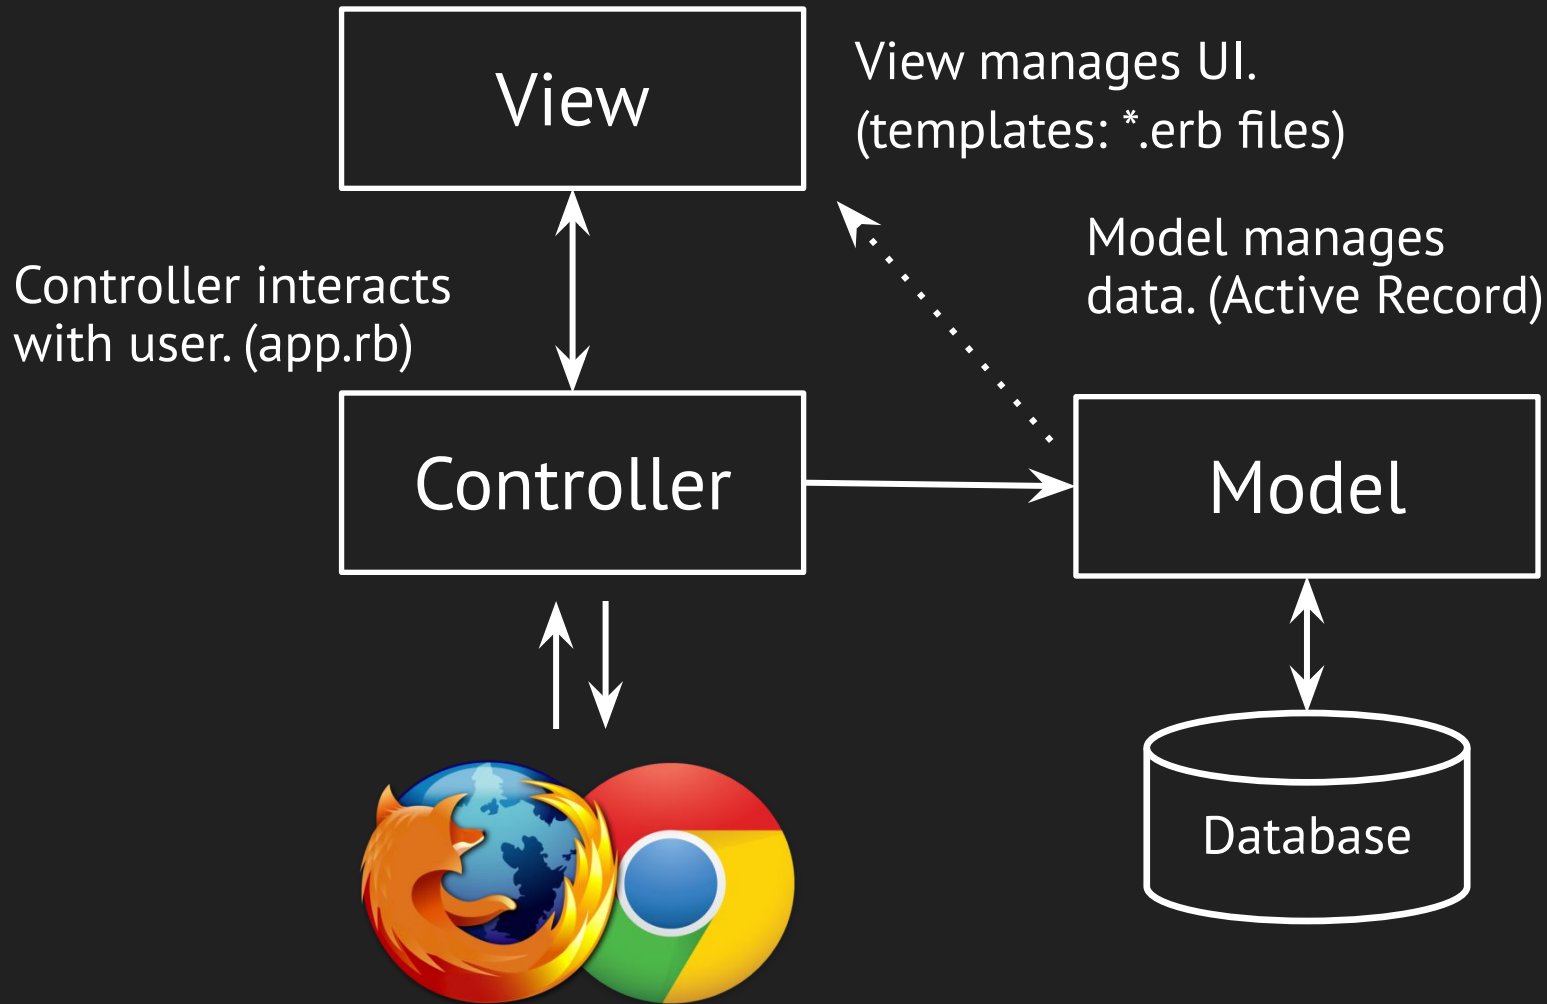

Today's Agenda:

- **Review of MVC** (with Sinatra) **and Active Record**
- **Rails Intro!** (with a worksheet)

Attendance

<https://bit.ly/2mFcZfr>

MVC (Review)

MVC (Review)

```
<form action="/form" method="post">  
  <input type="text" name="message">  
  <input type="submit">  
</form>
```

```
<form action="/form" method="post">  
  <input type="text" name="message">  
  <input type="submit">  
</form>
```

```
get "/form" do  
  erb: form  
end
```

MVC (Review)

```
post "/form" do  
  " You said  
  #{params[:message]}"  
end
```

MVC (Review)

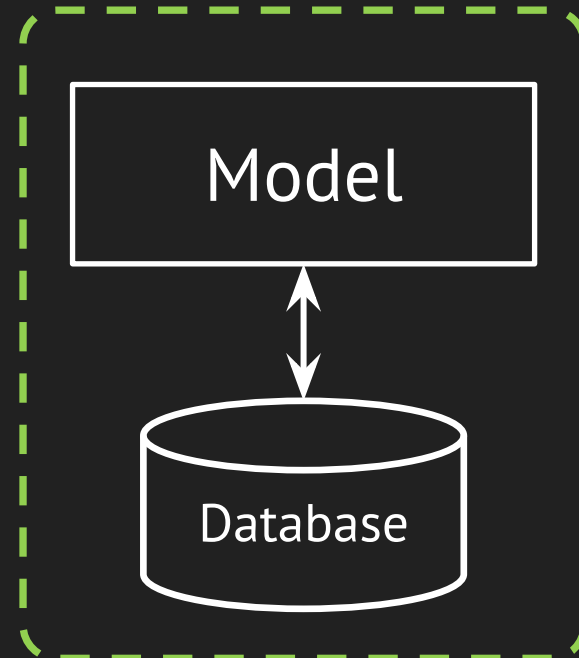

What about model?

```
post "/form" do
  " You said
  #{params[:message]}"
end
```

"/form "
Message=... "You said ..."
POST

Active Record (Review)

- An Implementation of the **object-relational mapping (ORM)** pattern.
- Automated **mapping** between classes and tables, attributes and columns
 - Basic operations on object: CRUD
 - (**C**reate, **R**ead, **U**ppdate, **D**elete)
- **Associations** between objects defined by simple class methods (will be covered later)

ActiveRecord Methods (Review)

```
class Article < ActiveRecord::Base {  
  :id      => :integer,  
  :title   => :string,  
  :content => :text  
}
```

ActiveRecord will dynamically “generate” methods based on the attributes in the table:

- *Article.find_by_title("Week 5")*
- *Article.find_by_title_and_content("First Record", "Hello world")*

Metaprogramming in ActiveRecord

```
def method_missing(meth, *args)
  if meth.to_s =~ /^find_by_(.+)$/
    attr = $1.split('_and_')
    find_by_attribute(attr, *args)
  else
    super
  end
end
End
```

- `Article.find_by_title("Week 5")`
- `Article.find_by_title_and_content("First Record", "Hello world")`

Use ActiveRecord in Sinatra

```
require 'sinatra'  
# db configuration  
db_options = {adapter: 'sqlite3', database: 'todos_db' }  
# establish connection  
ActiveRecord::Base.establish_connection(db_options);  
# write migration  
class CreateTodos < ActiveRecord::Migration  
  def change; create_table :todos ... end  
end  
# enforce migration  
createTodos.new.change  
# define the active record  
class Todo < ActiveRecord::Base  
  ...  
end
```

Use ActiveRecord in Sinatra

```
require 'sinatra'
# db configuration
db_options = {adapter: 'sqlite3', database: 'todos_db' }
# establish connection
ActiveRecord::Base.establish_connection(db_options);
# write migration
class CreateTodos < ActiveRecord::Migration
  def change; create_table :todos ... end
end
# enforce migration
createTodos.new.change
# define the active record
class Todo < ActiveRecord::Base
  ...
end
```

No need to memorize this.
Rails generates this for you.

Rails Command

- Automatically **generate/modify/extend/remove** framework & components
- Avoid manually typing common code (DRY)
 - Save you a lot of time and effort
- Enforce consistent code structure
 - All components of the system follows the convention
 - Improve readability, easier to maintain and extend

21 # Build JSON APIs with ease. Read more: https://github.com/rails-api/rails-api
22 gem 'rails-api', '~> 2.0'
23
```

rails new <app name>

- Generate MVC framework code files.
- **run bundle install**
 - Install ruby packages listed in the **Gemfile**

```
bash - "jacksongl-rail" x Immediate x +
jacksongl:~/workspace $ rails new toy-app
create
create  README.rdoc
create  Rakefile
create  config.ru
create  .gitignore
create  Gemfile
create  app
create  app/assets/javascripts/application.js
create  app/assets/stylesheets/application.css
create  app/controllers/application_controller.rb
create  app/helpers/application_helper.rb
create  app/views/layouts/application.html.erb
create  app/assets/images/.keep
create  app/mailers/.keep
```

Workspace

- rails-bootstrap
 - toy-app
 - app
 - bin
 - config
 - db
 - lib
 - log

 - db
 - lib
 - log
 - public
 - test
 - tmp
 - vendor
 - config.ru
 - Gemfile
 - Gemfile.lock
 - Rakefile
 - README.rdoc

File Structure

- **app**: core directory of app-specific code
- **bin**: app-specific wrapper scripts
- **config**: configuration files, e.g., db config
- **db**: database files
- **tmp, lib, log, test**: self explanatory

- **public**: static (HTML) files of site

- **Gemfile**: app's gem dependencies
- **Gemfile.lock**: locks dep gem versions
